Para pedir los peldaños, es necesario que nos indiquen el modelo, color, acabado, formato, referencia específica del peldaño y surcos.
Por ejemplo: Zentrum Grey natural 50x100 Gradone con surcos ó Zentrum Grey natural 60x60 peldaño ángulo, sin surcos.

For availability of the different steps as well as their price groups please consult with our commercial network.
In order to purchase steps, it is necessary to reference them as follow: *model name + color + finish + size + step specific reference + with or without grooves.
For example: Zentrum Grey Natural 50x100 Gradone 50 with grooves or Zentrum Grey Natural 60x60 Peldaño Ángulo without grooves.

FIXING & MAINTENANCE
COLOCACIÓN Y MANTENIMIENTO

Porcelánico

Caracteristicas:
Producto con muy poca absorción de agua, con altas prestaciones mecánicas y con resistencia química y a la helada. Es adecuado para el uso de interior y exterior en edificios residenciales. Las piezas especiales más utilizadas son los rodapiés, peldaños y gradones.

Revestimiento

Características:
Azulejo son las baldosas cerámicas con absorción alta de agua, prensadas en seco, esmaltadas y fabricadas por bicocción. Sus características los hacen indicados para su utilización como revestimiento de interiores en locales comerciales y residenciales. Las piezas complementarias más utilizadas son los listelos, decorados y cenefas.

Colocación

Compruebe que el formato, tono, color y calidad del material es el deseado. Recomendamos mezclar piezas de diferentes cajas para conseguir un efecto de uniformidad.
La superficie a revestir a de ser plana y rígida, tener absorción, textura, cohesión y estar seca y limpia de de restos de polvo y suciedad.

Adhesivos.
Los adhesivos recomendados para porcelànico son del tipo C1 o C2 (UNE-EN 12004). Cementos cola que tienen una alta adherencia, nula deformabilidad y alta resisitencia al contacto con agua. Adhesivo para productos de baja o nula absorción.
Los adhesivos para revestimientos se tienen que seleccionar en función del soporte y de las condiciones ambientales del espacio a revestir. La utilización de azulejos de absorción alta de agua es compatible con todas las técnicas de colocación.
Recomendamos la colocación en capa fina. Repartir uniformemente el adhesivo C1 o C2 con llana metálica, acorde al formato que se esta colocando. El encolado simple en capa fina se aplicará únicamente en la superficie a revestir. El doble encolado se aplica en el dorso de la pieza y en la superficie a revestir. Este método es recomendable cuando los formatos a colocar sean superiores a 30x30 cm. En áreas de alto tránsito, fachadas exteriores y cuando el producto sea porcelánico.
Leer y seguir las instrucciones del fabricante del adhesivo, respetando la proporción de agua y el tiempo abierto de colocación.
Aplicar con llana dentada uniformemente.
Es muy importante el reparto uniforme del adhesivo por toda la pieza. También es recomendable usar guías o crucetas entre las piezas, (disponibles en el mercado desde 1,5 mm. hasta más de 5 mm.) lo que facilitará la separación uniforme de las piezas.
No pisar el pavimento instalado durante el periodo de endurecimiento aconsejado por el fabricante del adhesivo. Es recomendable esperar como mínimo entre 48-72 horas antes de pisar la superficie.
Limpiar y aspirar los huecos de las juntas, para luego rejuntarlas.
Para colocación trabada es aconsejable ponerla a 1/3 de la pieza, nunca a mitad de la pieza.
Es importante el dejar una junta mínima entre piezas de 1,5 mm. Aconsejando un anchura mayor para formatos medianos y grandes. Para que puedan absorber las diferentes tensiones que se produzcan entre el soporte, adhesivo y baldosa.

Mantenimiento

Limpieza después de haber colocado el azulejo.
Los restos de suciedad que se generan tras la obra se eliminan fácilmente con un desincrustante comercial, o con un detergente de base acida , siempre teniendo en cuenta la resistencia química indicada por el fabricante de las baldosas.
No debe efectuarse nunca una limpieza acida sobre pavimentos recién colocados, ya que el ácido reacciona con el cemento no fraguado, pudiendo deteriorar las juntas o depositar compuestos insolubles sobre su superficie.
Es importante que el azulejo se aclare con abundante agua limpia después del proceso de limpieza con base acida este completo.
No deben utilizarse espátulas metálicas ni estropajos abrasivos, siendo recomendables las esponjas naturales.

Cuidado ordinario.
La limpieza cotidiana de las baldosas de gres es particularmente simple, ya que únicamente se necesita agua limpia a la que se le puede añadir un detergente de base alcalina.
El uso de ceras, aceites o productos similares no es recomendable, ya que la nula porosidad de la superficie de los azulejos impide su correcta aplicación.
Los decorados, piezas pintadas a mano, piezas complementarias y aquellas con acabos efecto lustre, nacarado, metálico u oro deben ser tratadas con delicadeza durante el proceso de colocación y durante el cuidado ordinario, ya que el uso de ácidos, puros o diluidos, detergentes u otros productos corrosivos pueden alterar de forma importante su apariencia original.

Porcelain Tile

Characteristics:
Product with very low absorption, high mechanical performance, chemical and frost resistance. It is suitable whether for using on interior or exterior floors of residential buildings. Special pieces normally employed are skirting tile, staircase step and gradone.

Wall Tile

Characteristics:
Glazed ceramic wall tile, dry pressed with high water absorption manufactured by double firing. Their characteristics make them especially suitable for using on interior walls of residential and commercial buildings. Complementary pieces usually include decors, borders and mosaics.

Fixing

Ensure that the size, shade, colour and quality of the material is that of what was expected. Mix pieces from several boxes to achieve a uniformed mixture.
The surface to be files on must be flat rigid, absorbent textures, cohesive, dry and clean of dust and dirt.

Adhesive
Recommended adhesives for porcelain tiles are those with C1 or C2 (UNE-EN 12004) features with a high adherence indeformable, and high resistance to water. Adhesives for products with low or zero absorption.
The adhesives used for wall tiles should be selected according to the substructure and the external environment of where it is being used. Wall tiles that are absorbent can be fixed by all different tile fixing methods.
We recommend the Thin Layer Method of tile installation. The C1 or C2 adhesive should be spread uniformly with a metal trowel that is suited to the tile size. With the Single Layer method, adhesive is only applied to the surface at where the tile is to be fixed. With the double Thin Layer Method, adhesive must be applied to both the rear side of the tile as well the surface of where the tile is to fixed. This method is recommended for tiles that are greater than 30x30 cm. In areas of high pedestrian traffic, facades in exteriors and always when fixing porcelain tiles.
Read and follow the instructions of the adhesive manufacturer with regards to amount of water needed to mix the adhesive and time in which it must be used.
Use a trowel with uniform teeth.
It is highly important that a uniform spread of adhesive is used over the entire tile, it is also recommended to use guides or spacers between the tiles (spacers of 1,5 mm to 5 mm are available on the market) which can be used to facilitate the uniform separation of the tiles.
Do not walk on floor tiles during the drying time of the adhesive. It is recommended to wait for at last 48-72 hours before walking or applying any weight on the tiles.
Clean and vacuum the spaces between the tiles before grouting.
For locked placement, it is advisable to fix a distance from 1/3 of the piece, never at half of the piece.
Strict observance of the 1,5mm minimum joint between floor tiles is essential, whit a wider joint being recommended for medium and large formats, this allowing absorption of the differential pressure produced in the multi-layer floor adhesive tile system.

Maintenance

Cleaning after fixing:
The most important cleaning operation is performed immediately after laying the tiles. Residues remaining after work completion can be easily removed with a commercial detergent or an acid-based one, always considering the chemical resistance indicated by the manufacturer.
Acid cleaning should never carried out on recently laid floor tiles. The reaction of the acid with the unset cement may damage the joints or deposit insoluble compounds on the surface.
It is also important that the tile receives a thorough rinsing with clean water after the cleaning process is complete.
Trowels and abrasive scotters must not be used. The use of sponges is strongly recommended, especially natural ones.

Routine Care:
Daily cleaning tiles is particularly simple, it only requires clean water to which an alkaline base cleaner may be added.
The use of waxes, oils or similar products is not recommended since the non-porous glazed surface prevents from a correct application.

Hand-painted ceramic wall tiles or complementary pieces on third firing must be treated whit extreme care during both the fixing and subsequent cleaning as well as during ordinary routine cleaning. The use of pure or diluted acids, detergents or other corrosive products will seriously harm their original look.

TECHNICAL SOLUTIONS
SOLUCIONES TÉCNICAS

VENTILATED FAÇADES / PORCELAIN

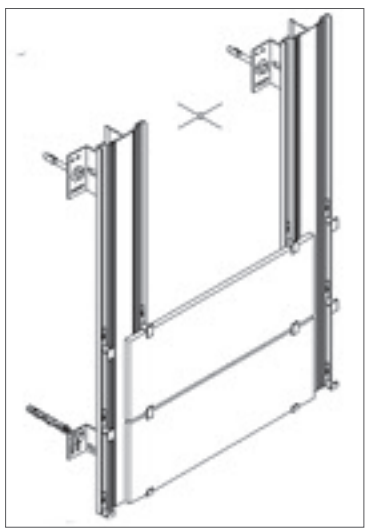

The ceramic ventilated façade is an exterior cladding system for buildings, the ideal combination between the maximum level of aesthetic appeal and the best thermal features. From the structural point of view, it is an overhang system, composed of an external facing in slabs of porcelain stoneware mechanically fastened to the perimeter framework of the building by means of a structure in aluminium alloy.Thanks to this particular construction technique, the surface of the cladding remains separate from the masonry. The resulting cavity is partially occupied by a layer of thermal insulating material, leaving the rest of the space empty to allow for ventilation. Therefore an “air jet” is created; that is, a continuous flow of aeration, which provides significant benefits in terms of breathability and a decrease of heat loads.

Advantages

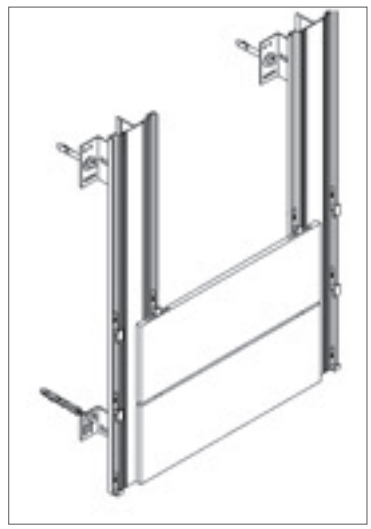

- Energy saving and thermal insulation and sound proofing. Protection against water.
- Healthier environment
- No deterioration of the appearance ot technical features over the time.
- Exceptional results in renovation works.
- Security when you fix coatings because you use mechanical and quimical anchorage.
- Easy to clean and to manipulate.

Type of sistem

Visible system:
The anchorage of the material by mounting clips, causes it to be visible from the outside.
This system, unlike the hidden system, does not require additional machining of the pieces.
Unvisible system:
By machining the lateral parts (grooved), the anchoring of the porcelain material can’t be seen from the outside.

Visible System. Anclaje Visto

Unvisible System. Anclaje Oculto

Glued Façades with Mechanical Anchorage / Porcelain

The glued façade upgrades the appearance of façades; providing them an aspect of innovation and lasting durability through the use of high-end technical porcelain. Currently, there are adhesives which enable an optimum bonding on the façade, however, in order to ensure maximum security, it is important to use a safety mechanical anchorage system which can be visible or hidden.

Advantages

- Greater impermeability and resistance against humidity and atmospheric agents.
- Lighter weight in comparison to façades made up of other materials.
- Minimum maintenance required.
